

LeadForge AI

Product Overview, Pricing, Use Cases & Sales Playbook

KNOWLEDGE BASE TEST DOCUMENT

Use this fictional document to test document upload, text extraction, indexing, search, retrieval, and grounded answer generation in the LeadForge AI prototype.

Document details

Field	Value
Document type	Product overview and sales enablement guide
Version	1.0 — fictional demonstration data
Purpose	Validate the prototype knowledge-base workflow
Updated	9 October 2026

Testing notice: All features, prices, performance figures, and customer examples in this document are fictional. They are not verified claims about a production product.

Suggested test: Upload this PDF, wait for indexing, then ask the sample questions at the end. A correct knowledge-base implementation should answer from the document and avoid inventing details.

1. Product overview

LeadForge AI is a proposed outbound sales workspace that brings prospect discovery, ideal customer profile (ICP) qualification, sales-context retrieval, outreach preparation, and pipeline tracking into one interface. It is designed to help sales teams prioritize relevant prospects instead of manually researching every account.

The prototype includes a Command Dashboard, ICP Configuration, Discovered Leads Repository, Deal Pipeline Kanban, Knowledge Base & Context Hub, and an Autonomous Activity Stream. The interface can display sample metrics while the product is being developed; sample figures must not be treated as live operational results.

2. Core capabilities

Capability	What it does	What it does not guarantee
ICP configuration	Stores target industries, company size, locations, decision-maker titles, exclusions, and scoring weights.	It does not prove a prospect will purchase.
Lead repository	Organizes prospect records, company details, fit scores, buying signals, and status.	A displayed record is not necessarily verified live data.
Pipeline Kanban	Tracks opportunities through defined sales stages and summarizes deal value.	Pipeline value is not the same as recognized revenue.
Knowledge base	Stores product documents, pricing notes, case studies, and sales playbooks for retrieval.	An indexed badge alone does not prove retrieval is working.
Outreach assistance	Uses prospect context and approved product information to draft personalized messages.	Drafting does not mean an email was sent.

3. Ideal Customer Profile (ICP)

An Ideal Customer Profile describes the kinds of organizations most likely to benefit from a product. LeadForge users can define criteria such as industry, employee count, region, annual revenue, job title, technology stack, and buying triggers.

Illustrative ICP: B2B software companies with 50–1,000 employees in the United States, Canada, the United Kingdom, or the European Union. Relevant decision-makers may include a VP of Sales, Head of Growth, VP of Revenue Operations, or Chief Commercial Officer. Example target industries include enterprise software, data analytics, fintech, and cybersecurity.

Illustrative exclusions include agencies and freelancers, companies with fewer than 10 employees, and organizations outside the selected market. Exclusion rules should be configurable by the user rather than hard-coded for every customer.

4. Fit scoring guide

For testing, use this simple illustrative 100-point scoring model. A production implementation should document its own formula and preserve evidence for each score.

Criterion	Maximum points	Example evidence
Industry alignment	25	Company operates in a selected target industry.
Company size	20	Employee count falls within the configured range.
Decision-maker relevance	20	Contact holds a relevant purchasing or influencing role.
Buying trigger	20	Publicly reported expansion, funding, hiring, or a relevant initiative.

Criterion	Maximum points	Example evidence
Technology / need alignment	15	Available evidence suggests a relevant workflow or technical need.

Example tiers: Tier A = 85–100, Tier B = 75–84, Tier C = below 75. These thresholds are only examples; an administrator may change them. A fit score indicates profile alignment, not purchase probability.

5. Fictional product packaging and pricing

The following packages are invented solely to test pricing-related retrieval. They do not represent a real commercial offer.

Plan	Monthly price	Included allowance	Intended customer
Starter	\$299 / month	1,000 discovery credits; 3 users	Small sales teams testing structured outbound workflows
Growth	\$799 / month	5,000 discovery credits; 10 users	Growing teams running repeatable prospecting campaigns
Enterprise	Custom quote	Negotiated limits; SSO and integration review	Organizations requiring custom controls and integrations

Credit policy

Discovery credits are a fictional usage unit for this test document. In this example, one credit is consumed per prospect record successfully enriched. A failed enrichment does not consume a credit. Credits reset at the start of each billing month and unused credits do not roll over.

6. Fictional customer scenario

Customer: Northstar Metrics (fictional). Industry: B2B analytics software. Team size: 8 sales and growth employees. Challenge: representatives spend too much time identifying accounts and preparing first-touch messages. Goal: centralize prospect research, make qualification criteria consistent, and reduce manual preparation.

Illustrative workflow: the team configures an ICP, imports or discovers accounts from an approved provider, reviews the available evidence behind fit scores, retrieves an approved case study from the knowledge base, drafts a personalized message, and tracks the opportunity in the pipeline. Any performance improvement must be measured during a real pilot; this document makes no claim that a specific improvement has been achieved.

7. Outreach messaging guidelines

A good first-touch message should be concise, relevant, factual, and respectful. It should mention a specific, verified reason for contacting the prospect, connect that reason to a supported product benefit, and offer a low-friction next step. Do not invent funding events, hiring plans, technology usage, customer names, or performance results.

Example template

Subject: Improving prospect research at [Company]

Hi [First name],

I noticed [verified company-specific signal]. Teams working on [relevant goal] often need a reliable way to prioritize accounts and prepare relevant outreach. LeadForge AI is designed to bring ICP qualification, prospect context, and sales workflow tracking into one workspace.

Would a brief conversation next week be useful?

Best,
[Sender name]

This is a template, not a message that has been sent. Replace every bracketed field with verified information before use.

8. Security and data handling principles

Use authorized data sources and follow applicable privacy, anti-spam, and provider terms. Collect only information needed for the sales workflow. Restrict access by user role, protect credentials, log meaningful actions, and provide a way to correct or delete inaccurate prospect information. Do not store API keys in frontend code or commit secrets to source control.

For a prototype, browser localStorage is suitable only for non-sensitive demo data. A production application should use a secured backend and database, server-side secrets, appropriate access controls, backups, and a documented retention policy.

9. Knowledge-base validation questions

After uploading and indexing this document, ask these questions in the Knowledge Base interface. Compare the generated answers with the expected facts below.

Q1. What are the three fictional subscription plans and their prices?

Expected answer: Starter: \$299/month; Growth: \$799/month; Enterprise: custom quote.

Q2. How many discovery credits are included in the Growth plan?

Expected answer: 5,000 discovery credits per month, with 10 users.

Q3. What is the maximum score for buying-trigger evidence?

Expected answer: 20 points in the illustrative scoring model.

Q4. Does an ICP fit score mean a prospect will buy?

Expected answer: No. It indicates how closely the prospect matches the target profile; it is not purchase probability.

Q5. What happens to unused discovery credits?

Expected answer: They do not roll over; the allowance resets at the start of each billing month.

Q6. What is the fictional customer in the scenario called?

Expected answer: Northstar Metrics.

Q7. What should a personalized outreach message be based on?

Expected answer: A verified company-specific signal, a supported product benefit, and a clear low-friction next step.

Q8. Does this document prove LeadForge has sent emails or achieved a specific performance improvement?

Expected answer: No. It is fictional test content and does not verify production behavior or measured results.

Q9. Which storage approach is suggested for non-sensitive prototype demo data?

Expected answer: Browser localStorage; production should use a secured backend and database.

Q10. What should the system do if an answer is not in the document?

Expected answer: It should say the information is not available in the provided context instead of inventing an answer.

10. Pass criteria for the prototype

A basic knowledge-base test passes when the application can accept the PDF, show a sensible document title and status, make its text searchable, retrieve relevant passages for questions, and answer with facts that agree with the document. If retrieval or parsing is not implemented yet, the UI should clearly show that the document is demo metadata or not yet processed.

Recommended checks

- Upload succeeds and rejects unsupported file types gracefully.
- Document title and category can be searched.
- Re-indexing updates the document status only after processing succeeds.
- Answers reflect the pricing table and scoring guide accurately.
- Unsupported questions produce an uncertainty response rather than fabricated facts.
- Removing the document also removes it from future retrieval.
